AI Gateway Agent Status

Which agents the ai-gateway agent-manager actually wires today on main-08272026, which ship dark, and which were wired by the all-agents branch and later reverted.

Field	Value
Date	2026-10-13
Repository	SquareX-AI/ai-protect
Applies to	main-08272026 **and** main-08272026-all-agents. Both point at the same commit, so this status is the status of main-08272026 itself.
Commit	b37c7caa (HEAD of origin/main-08272026, origin/main-08272026-all-agents, and the local all-agents branch)
Source of truth	ai-gateway/agent-manager/src/agents/*.rs, mod.rs (ENABLED_AGENTS, build_adapters), ai-gateway/util/src/agent_configs.rs

1. Summary

- **This is the state of main-08272026.** main-08272026-all-agents was fast-forwarded to it on 2026-10-13 and carries no commits of its own, so everything below describes the mainline branch.
- **Six agents are enabled** in the product allowlist: claude, gemini, codex, copilot, devin, copilot-desktop. Five of them have a live LLM leg. Codex is enabled but its LLM leg is hard-coded off, so only its MCP leg is wired.
- **Thirteen more adapters exist in code but ship dark**: they are not in the allowlist, so bootstrap never wires them regardless of what their spec declares.
- **The all-agents branch widened the allowlist to all 18 adapters and wired LLM legs for 13 of them.** That work was merged as PR #717 on 2026-09-08 and reverted the same day. Only Devin's leg was re-landed afterwards (2026-09-10).
- **No agent files were added by the all-agents branch.** Every adapter file dates from 2026-08-10 to 2026-08-14. Copilot Desktop (2026-10-08) came from the separate copilot-desktop effort.

2. How an agent gets wired

An agent is wired only when **enabled AND installed AND the adapter reports the capability**. Enablement is the ENABLED_AGENTS allowlist in mod.rs. Capability comes from the adapter: for registry-driven Spec adapters, MCP support is always true and LLM support is read from the *enabled* flag inside the spec's LlmRouting value (BaseUrl or ForwardProxy). Handwritten adapters (Claude, Aider, Amp, OpenClaw) implement the supports_* methods directly.

3. Working now (enabled and wired)

Agent	MCP leg	LLM leg	Mechanism	Notes
Claude	Yes	Yes	Base URL (handwritten adapter)	The original, fully wired adapter.
Gemini	Yes	Yes	ForwardProxy, enabled: true	Doc comment in mod.rs says its LLM leg is off; the code says on. See section 6.
Copilot CLI	Yes	Yes	ForwardProxy, enabled: true	Same doc/code mismatch as Gemini.

Agent	MCP leg	LLM leg	Mechanism	Notes
Copilot Desktop	No	Yes	ForwardProxy via HTTPS_PROXY, enabled: true	Added 2026-10-08. Registry comment: GATED, no live desktop-app account has verified it yet. install_marker_file = data.db to disambiguate ~/.copilot from the CLI.
Devin	Yes	Yes	ForwardProxy via proxy.url + mode: manual	The one piece of the all-agents work that survived; re-ported in a839fd53 on 2026-09-10.
Codex CLI	Yes	**No**	BaseUrl (ModelProvider form), **enabled: false**	Enabled in the allowlist, but the base-URL form is unverified against a live install, so the LLM leg stays off.

4. Present in code, shipping dark (not in the allowlist)

Agent	LLM leg declared	State on HEAD
Cursor	ForwardProxy, enabled: true	Leg defined but agent not in allowlist; nothing is wired.
Windsurf	ForwardProxy, enabled: true	Same as Cursor.
Grok	None	MCP-capable spec only.
Kiro	None	MCP-capable spec only.
Antigravity	None	MCP-capable spec only.
Amazon Q	None	MCP-capable spec only.
Continue	None	MCP-capable spec only.
Zed	None	MCP-capable spec only.
OpenCode	None	MCP-capable spec only.
VS Code	None	MCP-wired but dormant: discovery routes vscode to copilot.
Aider	Handwritten, gated	supports_llm_base_url returns false; comment says flip once verified on live Aider.
Amp	None	SKELETAL: detection only, no config surface to wire.
OpenClaw	None	SKELETAL: detection only, no config surface to wire.

5. Wired at one point, then reverted

The all-agents branch's nine commits of 2026-09-01 were squash-ported onto the registry-driven config design in commit e345e71e, merged to main-08272026 as PR #717 (86447c96) on 2026-09-08, and reverted in 48612a27 the same day. The following is what that merge contained and what is gone from HEAD today.

5.1 Allowlist

Widened from 6 to all 18 adapters. The twelve added: cursor, grok, windsurf, antigravity, kiro, amazon_q, continue, zed, opencode, vscode, aider, amp, openclaw. HEAD is back to six.

5.2 LLM legs that existed in the merge and do not exist on HEAD

Agent	Reverted mechanism	Status on HEAD
Grok	BaseUrl via JsonPath in a separate user-settings.json, upstream api.x.ai	No LLM leg.
Zed	BaseUrl via JsonPath	No LLM leg.
OpenCode	BaseUrl via JsonPath	No LLM leg.

Agent	Reverted mechanism	Status on HEAD
OpenClaw	Plain Spec: JsonPath baseUrl + nested mcp.servers container	Skeletal handwritten adapter.
Kiro	ForwardProxy via http.proxy + proxySupport override	No LLM leg.
Continue	ForwardProxy via requestOptions.proxy (CA-bundle leaf a flagged gap)	No LLM leg.
Antigravity	Process-env leg, gated on CLI already being in API-key mode	No LLM leg.
Amp	Process-env: HTTPS_PROXY / HTTP_PROXY / NODE_EXTRA_CA_CERTS	Skeletal.
Aider	openai-api-base config leg plus Anthropic-family process-env leg (ANTHROPIC_API_BASE / SSL_CERT_FILE)	Gated off.
Cursor	Handwritten adapter, process-env leg for cursor-agent	ForwardProxy leg from later unrelated work; not enabled.
Windsurf / Devin Desktop	Resolved::WindsurfUserData dual-branding directory detection, Devin-first	ForwardProxy leg; not enabled.
Codex	BaseUrl leg flipped to enabled: true (wire_api confirmed)	Back to enabled: false.
Devin	ForwardProxy via proxy.url + mode: manual	**Re-landed** in a839fd53 (2026-09-10). Enabled.
VS Code	mcp.json reached via the registry's config-delta path (no adapter change)	MCP-wired but dormant.

5.3 Supporting changes also reverted

- ListenerNeed::of gained a third arm so a process-env-only agent (Antigravity) still gets a listener bound.
- BaseUrlForm::JsonPath variant and Llm::JsonPath registry shape (Llm::ProxyPath later came back with Devin).
- src/ai_broker_env per-command shell-function mechanism for scoping Amp/Cursor's shared process-env vars.
- YAML merge support in config_merge.rs; Continue's real mcpServers/zax.json discovery path.

6. Known inconsistency: allowlist doc comment vs code

The doc comment above ENABLED_AGENTS in mod.rs states that Gemini, Codex and Copilot are enabled but have supports_llm_base_url == false, so their LLM leg stays off, and that Claude and copilot-desktop are the only enabled agents with the LLM leg on. The code disagrees for Gemini and Copilot CLI: both declare LlmRouting::ForwardProxy with enabled: true, and the Spec adapter's supports_llm_forward_proxy reads exactly that flag. The comment predates the forward-proxy leg and is stale. Trust the code; correct the comment the next time mod.rs is touched.

7. Branch provenance

- main-08272026-all-agents had two commits of its own: the port e345e71e and a merge 785b8bf4. Both became ancestors of main-08272026 through PR #717, so after the revert the branch was 0 ahead / 1282 behind main.
- On 2026-10-13 the branch was rebased onto origin/main-08272026. With zero unique commits that was a pure fast-forward to b37c7caa, and the branch was pushed. Workspace debug build and daemon release build both passed with 0 errors.
- The reverted content is still in history. To bring it back on a current base, revert the revert or cherry-pick the port:

```
git revert --no-edit 48612a27
git cherry-pick e345e71e
```

Either will conflict in mod.rs (registry and allowlist), devin.rs (separately re-ported), and the copilot-desktop additions, all of which changed after September.

8. Related, not on this branch

- VS Code Copilot (vscode_copilot.rs, CAPI-discovery relay) exists only on main-08272026-vscode-copilot. A compile fix adding the three post-merge spec fields was committed there as 98470206 on 2026-10-13.
